

Using MQTT for a Clockchain on Docker containers

Phillip G. Bradford

Outline

Objective

First steps

Sketch of Final system

Objective

Final destination is

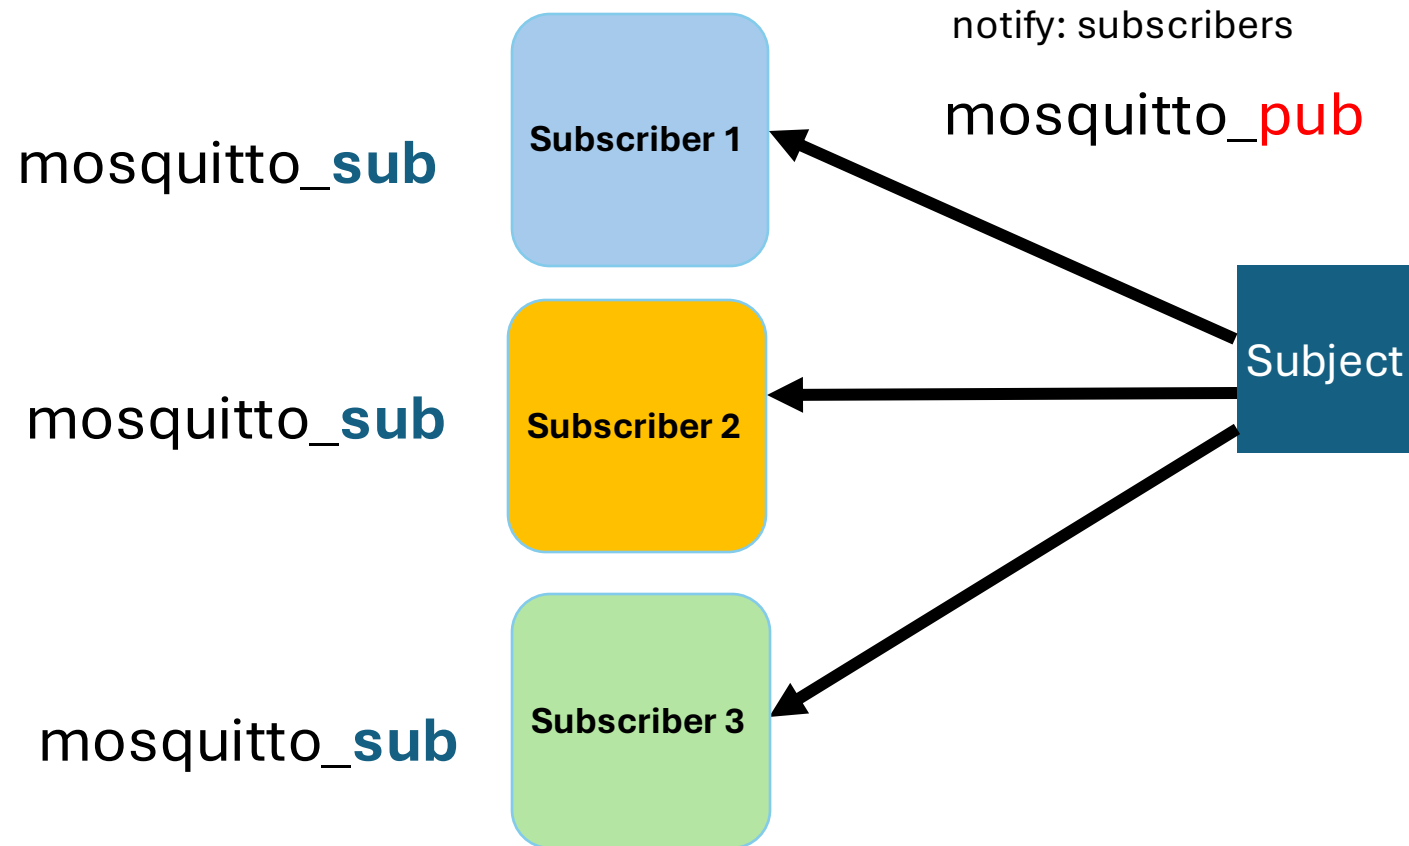

1. a basic Clockchain running on Docker containers
2. the containers mine blocks and communicate using MQTT

MQTT

MQTT – message queue telemetry transport

Publish-subscribe

Subscriber: High-level

MQTT

First steps

MQTT – a publish and subscribe message system

One system serves as the message broker

All clients can publish or subscribe to the broker

We use paho mosquitto MQTT

All Computers> `sudo apt update`

Broker computer> `sudo apt install mosquitto mosquitto-clients`

Client computers> `sudo apt install mosquitto-clients`

First steps: validation

To validate the way this will work

Install paho.mqtt on an Ubuntu instance

Initially Ubuntu will serve as the broker and clients

We will need three terminals

Copy the files CC1.py and CC2.py from ch8 in

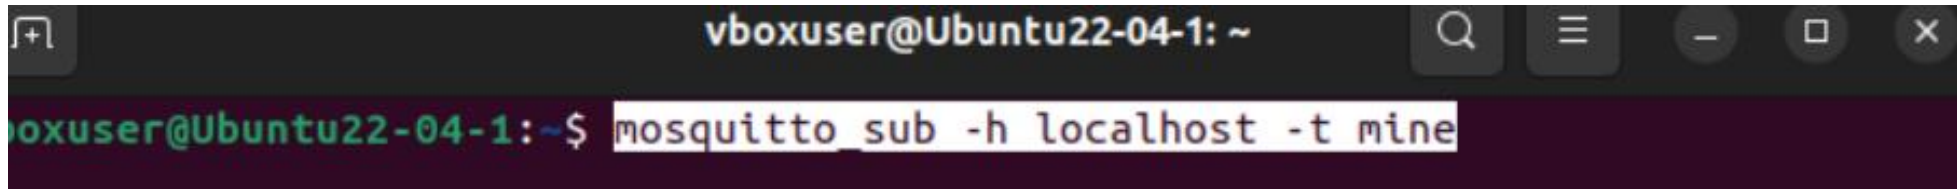

<https://github.com/wonder-phil/ChainsThatBindUs>

First steps – is paho-mqtt working?

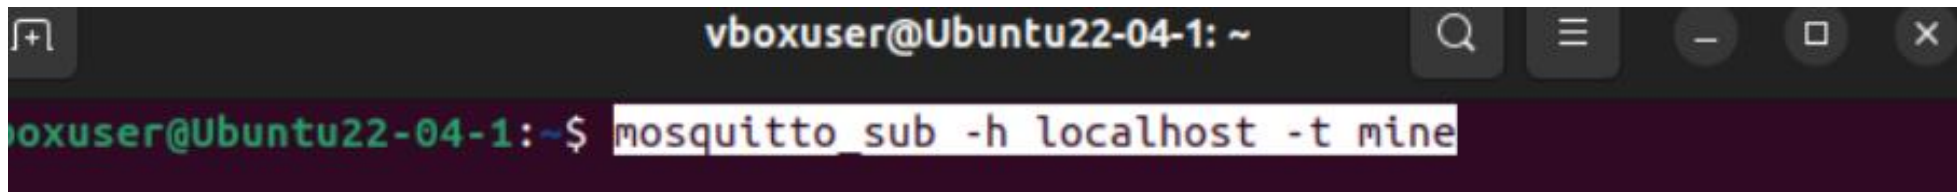

Terminal 1> mosquitto_sub -h localhost -t mine

Terminal 2> mosquitto_sub -h localhost -t mine

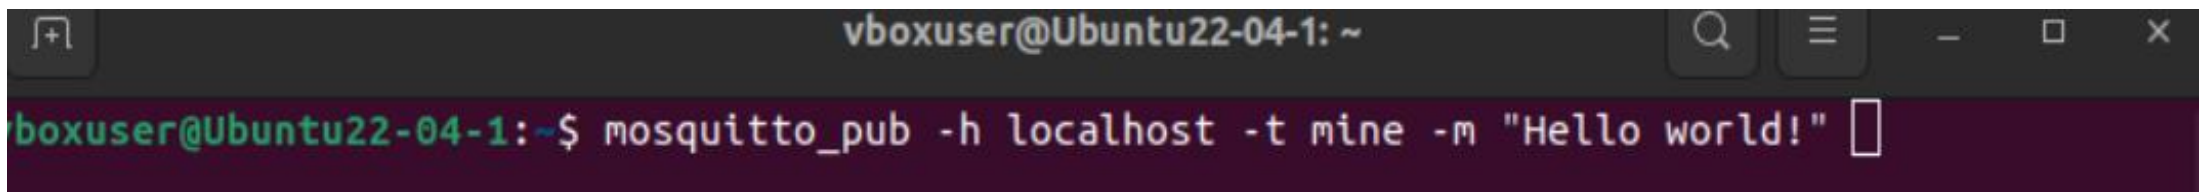

Terminal 3> mosquitto_pub -h localhost -t mine -m “Hello world!”

A terminal window with a dark background and light green text. The title bar shows 'vboxuser@Ubuntu22-04-1: ~'. The command 'mosquitto_sub -h localhost -t mine' is entered and highlighted in white.

```
vboxuser@Ubuntu22-04-1: ~  
vboxuser@Ubuntu22-04-1:~$ mosquitto_sub -h localhost -t mine
```

A terminal window with a dark background and light green text. The title bar shows 'vboxuser@Ubuntu22-04-1: ~'. The command 'mosquitto_sub -h localhost -t mine' is entered and highlighted in white.

```
vboxuser@Ubuntu22-04-1: ~  
vboxuser@Ubuntu22-04-1:~$ mosquitto_sub -h localhost -t mine
```

A terminal window with a dark background and light green text. The title bar shows 'vboxuser@Ubuntu22-04-1: ~'. The command 'mosquitto_pub -h localhost -t mine -m "Hello world!"' is entered and highlighted in white.

```
vboxuser@Ubuntu22-04-1: ~  
vboxuser@Ubuntu22-04-1:~$ mosquitto_pub -h localhost -t mine -m "Hello world!"
```

First steps – is paho-mqtt working?

Once this paho MQTT using mosquitto and mosquitto-client is verified

Copy the files CC1.py and CC2.py from ch8 in <https://github.com/wonder-phil/ChainsThatBindUs>

To the main directory

/home/user

Pip install paho-mqtt

Using Python3 pip install paho-mqtt

```
Ubuntu> pip install paho-mqtt
```

Running CC1 and CC2

Ensure each terminal is in /home/user

Terminal 1> python3

Python 3.10.12 (main, Nov 6 2024, 20:22:13) [GCC 11.4.0] on linux

Type "help", "copyright", "credits" or "license" for more information.

```
>>> from CC1 import run_chain
```

```
>>> run_chain()
```

Terminal 2> python3

Python 3.10.12 (main, Nov 6 2024, 20:22:13) [GCC 11.4.0] on linux

Type "help", "copyright", "credits" or "license" for more information.

```
>>> from CC2 import run_chain
```

```
>>> run_chain()
```

Starting the Clockchains CC1 and CC2

Terminal 3> mosquitto_pub -h localhost -t mine -m “start”

One Clockchain

```
mine topic says : CC1 wins done
start mining
prevHash: genesis
data: data
time: 2024-12-05 11:15:15.701678
nonce: 8511682
interrupted: False
bHash: 000002e011c6b81b4b1fb5a664adb6a552cccc19ec9ca0dedc11fed0c8cb09f7
mine topic says : CC1 wins done

start mining
mine topic says : CC2 won!
mine topic says : CC1 wins done
prevHash: genesis
data: data
time: 2024-12-05 11:15:15.701678
nonce: 12836013
interrupted: False
bHash: 00000cb339c7d102c6cb1fab018d81f0b0c81a0242e406e8150f596e6bf439ab

mine topic says : CC2 won!
start mining
mine topic says : CC2 won!
```

Use the Ubuntu VM as the broker

```
Ubuntu> sudo nano /etc/mosquitto/mosquitto.conf
```

Add these two lines (security risk!):

```
allow_anonymous true  
listener 1883 0.0.0.0
```

```
Ubuntu> sudo systemctl restart mosquitto.service
```

Installing the tools on Docker containers
